

EEE 6608: Machine Learning and Pattern Recognition

Final assignment – October 2024 Semester

Due date: September 03, 2025 (the portal will close at 3pm)

Final assignment instructions:

The goal of this project is to implement a movie recommendation system from scratch. We will be using a cut-down version of the MovieLens dataset. There are 100,000 ratings applied to 9,000 movies by 600 users. Download the dataset from [here](#). You may want to read the [readme file](#) to understand more about how the data is presented in this dataset. Your project report must have the following:

1. Plot of loss values versus iterations for a constant feature dimension n
2. Plot of loss values versus feature dimension n for a constant number of iterations
3. You will have to submit a report on this assignment that will contain your **code, result plots and a brief discussion**. You can add other sections in the report if you deem necessary.
